

## Kinematics

2 Dimensional Motion Projectile Example Problem

Name $\qquad$
Teacher $\qquad$
Period $\qquad$

Purpose - To investigate projectiles fired at angles.

An object is fired at a speed of $14 \mathrm{~m} / \mathrm{s}$ at three different angles.

- Identify the trajectories in the chart below on the diagram to the right as $\mathrm{v}_{1}, \mathrm{v}_{2}$ or $\mathrm{v}_{3}$.
- Resolve each of the velocity vectors into horizontal and vertical components.
- Rank the time of flight for each velocity.

| Velocity | Horizontal Component | Vertical Component | Time of Flight |
| :---: | :---: | :---: | :---: |
| $v_{1}=14 \mathrm{~m} / \mathrm{s}$ at $30^{\circ}$ |  |  |  |
| $\mathrm{v}_{2}=14 \mathrm{~m} / \mathrm{s}$ at $50^{\circ}$ |  |  |  |
| $\mathrm{v}_{3}=14 \mathrm{~m} / \mathrm{s}$ at $70^{\circ}$ |  |  |  |

Launch the Projectile Motion simulation. http://phet.colorado.edu/en/simulation/projectile-motion
Adjust the speed to $14 \mathrm{~m} / \mathrm{s}$ then fire three projectiles at $30^{\circ}, 50^{\circ}$ and $70^{\circ}$. Keep all other initial conditions as given.

Draw an FBD for each of the three shots and circle one of the three choices, $\uparrow \downarrow$ zero, that describes the projectile's motion. Ignore air resistance.

Circle either constant, changing or zero, draw an arrow in the direction of the velocity and give the value of the acceleration of the projectile while in the air. Ignore air resistance.
While the projectile is ascending its:

- horizontal velocity is constant/changing/zero and points $\qquad$ and the acceleration is $\qquad$
- vertical velocity is constant/changing/zero and points $\qquad$ and the acceleration is $\qquad$

## When the projectile is at the apex its:

- horizontal velocity is constant/changing/zero and points $\qquad$ and the acceleration is $\qquad$
- vertical velocity is constant/changing/zero and points $\qquad$ and the acceleration is $\qquad$
While the projectile is descending its:
- horizontal velocity is constant/changing/zero and points $\qquad$ and the acceleration is $\qquad$
- vertical velocity is constant/changing/zero and points $\qquad$ and the acceleration is $\qquad$

In the chart to the right, identify each of the following equations as describing either horizontal or vertical motion.

List the two different types of motion.
$\qquad$ ,
Which type of motion describes the horizontal equation(s) $\qquad$
Which type of motion describes the vertical equation(s)

| Equation | Horizontal <br> Motion | Vertical <br> Motion |
| :---: | :---: | :---: |
| $v=\frac{\Delta d}{\Delta t}$ |  |  |
| $a=\frac{v_{f}-v_{i}}{\Delta t}$ |  |  |
| $\Delta d=v_{i} \Delta t+\frac{1}{2} a \Delta t^{2}$ |  |  |
| $a=\frac{v_{f}{ }^{2}-v_{i}{ }^{2}}{2 \Delta d}$ |  |  |

What ties the horizontal and vertical equations of motion together? $\qquad$
Rewrite the equations below adding the subscripts " $x$ " and " $y$ " to the appropriate variables. Where appropriate replace the acceleration "a" with " $g$ ".

|  | Projectile Motion Equation |  |  |
| :---: | :---: | :---: | :---: |
|  |  | Horizontal (X) | Vertical (Y) |
| $\mathrm{v}=\frac{\Delta \mathrm{d}}{\Delta \mathrm{t}}$ | becomes |  |  |
| $\mathrm{a}=\frac{\mathrm{v}_{\mathrm{f}}-\mathrm{v}_{\mathrm{i}}}{\Delta \mathrm{t}}$ | becomes |  |  |
| $\Delta \mathrm{d}=\mathrm{v}_{\mathrm{i}} \Delta \mathrm{t}+\frac{1}{2} \mathrm{a} \Delta \mathrm{t}^{2}$ | becomes |  |  |
| $\mathrm{a}=\frac{\mathrm{v}_{\mathrm{f}}{ }^{2}-\mathrm{v}_{\mathrm{i}}{ }^{2}}{2 \Delta \mathrm{~d}}$ | becomes |  |  |

Adjust the cannon's position until the crosshair on the cannon lies on the horizon (ground level). Fire a projectile at $14 \mathrm{~m} / \mathrm{s}$ at $40^{\circ}$ above the horizontal. Calculate the time of flight, the range and the maximum
 height of the projectile. Use the tape measure to check your answers.
All measurements will be made with the tape measure in the horizontal or vertical position.

Left click on the cannon and hold. Adjust the vertical elevation of the cannon. Fire another projectile at $14 \mathrm{~m} / \mathrm{s}$ at $40^{\circ}$ above the horizontal. How does the vertical elevation affect the time of flight, the range and height of the projectile?
